

Supporting Urban Mobility Management

Objective: To improve the management of urban mobility in Malaga, reinforcing the Malaga Police through the use of a 5G Private Network, deployed in the city centre, which allows the use of critical communications between police officers, including the transmission of video in real time.

Description:

Telefónica's 5G technology is key for two reasons

-For the possibility it offers to connect police forces in a private 5G network that guarantees the availability of resources for communications in emergency situations, independently of the congestion of the commercial network.

-Because of the availability of computing resources at the edge of the network (Edge Computing) that can add value to these communications, such as, for example, real-time analysis of video captured by a mobile camera connected by 5G using artificial intelligence.
