

Remote Municipal Management of Public Spaces

Objective: To improve the management of the city's public spaces, especially during the summer season, when the municipality's population multiplies to 400,000 inhabitants. The municipal spaces that will have the technological support of 5G are the city centre and the Torremolinos beach.

Description:

Telefónica's 5G technology is key for two reasons

-For the possibility it offers to connect police forces in a private 5G network that guarantees the availability of resources for communications in emergency situations, independently of the congestion of the commercial network.

-Because of the availability of computing resources at the edge of the network (Edge Computing) that can add value to these communications, such as, for example, real-time analysis of video captured by a mobile camera connected by 5G using artificial intelligence.
